Breathing air cylinder cover 6.8L CFK

2005360

Cover for composite (CFK) breathing apparatus air cylinder 6.8 L. Made of non-combustible Nomex material, dark blue.

Nomex is a flame-resistant meta-aramid material that is ideal for use in hazardous situations (fighting structural and other fires). Isolation devices and cylinders are designed to withstand most hazards in interventions. Regardless of the high resistance, cylinders with compressed air can already lose their operational safety due to surface damage and become unusable. Therefore, it is important to maintain the air cylinders as well as possible and protect them from possible damage.

Our protective covers meet all the basic needs of protecting your air cylinders. Perfect visibility in any situation is ensured by a double reflective strip made of non-combustible material (yellow-silver-yellow color). There is a velcro strip on the top that secures the protective cover and prevents the cover from sliding off the cylinder.
