

Angle Suction Strainer 75 mm

1033128

The angle suction strainer is specially designed to allow water to be pumped out at low levels.

The suction strainer (basket) is intended for pumping clean and dirty water. The strainer can be connected to the fire suction hose using the Storz fire coupling Ø75 located on the strainer. It contains a non-return valve that prevents water return after pumping has stopped.

Due to its design, this suction strainer is very efficient at pumping water at low levels. As a firefighter, you have probably encountered a problem many times at water pumping fire interventions, when you have to stop pumping due to very low water levels. The Angle suction strainer increases your efficiency as it allows water to be pumped to the lowest possible level.
