

Hose Line Pressure Limiting Valve

1033381

The pressure limiting valve protects hoses and fittings from damage. Provides equal pressure in hose and fittings at all times.

Pressure changes can occur due to the displacement of the hoses while they are pressurized, their bending or opening and closing of the valves on the fittings. The water pressure limiting valve protects fire hoses and fittings while being useful for firefighters' safety while operating with a water jet. It is especially useful for firefighters working at altitudes (ladders, etc.), because by its equalizing water pressure it prevents the hose and the nozzle from twitching when losing / increasing the pressure in the valve.

It consists of a pressure gauge through which the desired pressure is monitored and adjusted.

Technical specifications

Color	Red
Weight	approx. 5,7 kg
Standard / Norm	DIN 14362
