

Hytrans AutoBoost Water Pump

100479

The Hytrans® AutoBoost pump has been developed to increase the possible length of a Hytrans® water supply line without adding extra HydroSub® units. The units are controlled by an easy to operate Human Machine Interface, an advanced monitoring system (CANbus) and programmed to maintain automatically, within specified flows, the preset outlet pressure.

The Hytrans® AutoBoost unit consists of a water pump, direct driven by a powerful diesel engine. Capacity of AutoBoost units can be up 45000 ltr/min (12000 gpm) @ 12 bar (175Psi). Depending on the needed capacity Hytrans® can advise the most suitable model.

Use:

- Firefighters
- Civil Protection
- Industry
