

Hytrans FloodPumps

100481

The Hytrans® FloodPump is designed for providing flood relief on large scale. In combination with the HydroSub® 60 it is possible to reach a capacity up to 20000 liter/min. The pump is mounted in a stainless steel demountable frame with a single floater.

Depending on the circumstances the pump can be used without floater or even without the frame in case of narrow accessibility. The special low friction and light weight 12" flood hose can easily be deployed by only one person. The separate hose lengths are connected with a simple strap.

Use:

- Pumping out underground garages
- Pumping out flooded areas (urban and rural)
